Title of the project

Online Hotel Reservations

Introduction

Online hotel reservations are a popular method for booking hotel rooms online. Travellers can book rooms on a computer by using online security to protect their privacy and financial information and by using several online travel agents to compare prices and facilities at different hotels. Prior to the Internet, travellers could write, telephone the hotel directly, or use a travel agent to make a reservation. Nowadays, online travel agents have pictures of hotels and rooms, information on prices and deals, and even information on local resorts. Many also allow reviews of the traveller to be recorded with the online travel agent. Online hotel reservations are also helpful for making last minute travel arrangements. Hotels may drop the price of a room if some rooms are still available.

Existing System

The purpose of this is to develop and implement an online hotel reservation system for hotels, that will replace the manual method of booking for hotel rooms.

The previous system for booking rooms were faced with so many problems like, delay in processing the customer booking or paying for rooms that is below or beyond his standard, causes difficulty for emergency booking.

The use of online view of room rates and uploading of available rooms and facilities was used for the new system so that the customer can view and make his choice before arrival, and also in the case of emergency travelling. This new system assisted the hotel owners in managing their hotels, because they can also regulate the receptionist moves and avoid fraudulent activities. It also increased the efficiency of the hotel managers and also their profit margin, once they have a better and good facilities.

Benefits

- ❖ Easily integrate in Hotel Website
- ❖ Simplify Hotel Booking Process
- ❖ Instant Booking Confirmation
- ❖ Reduces operational costs
- ❖ Saves time
- ❖ Online Hotel inventory Distribution
- ❖ Hotel Management
- ❖ Improve customer booking experience
- ❖ Increase booking and revenue

Advantages

- ❖ Can book from anywhere as its online.

- ❖ Can see hotel room without booking.
- ❖ Can solve the problem of Emergency booking.
- ❖ It's a Responsive website so can be accessed from almost any device
- ❖ You get rooms at discounted rates as direct contact from Customer to Hotel reception
- ❖ It's an online service so rooms can be booked anytime.
- ❖ Customer can view and make his choice before booking.

Key features of Hotel Booking System

- ❖ Hotel Search and Book Functionality
- ❖ Payment Gateway integration
- ❖ Mobile-responsive design
- ❖ Detailed Reports

System Requirements

- ❖ Operating System: Any
- ❖ Server Technology: PHP/XAMPP
- ❖ Database: MySQL
- ❖ Markup Language: HTML
- ❖ Scripting Language: CSS/JavaScript

Entity Relationship Diagram

Entity Relationship Diagram is a graphical model of the data needed by a system,

including things about which information is stored and the relationship among them, produced in structured analysis and information engineering. On the entity relationship diagram, rectangles represent data entities, and the lines connecting the rectangles show the relationship among data entities.

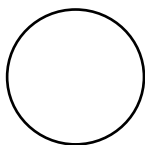

ERD Notations:

Rectangle:

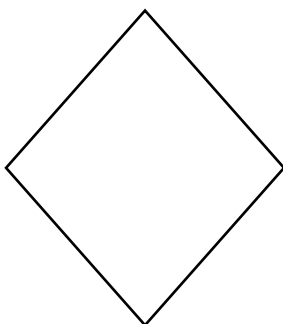

Represents Data Entity

Circle:

Represent connection

Diamond:

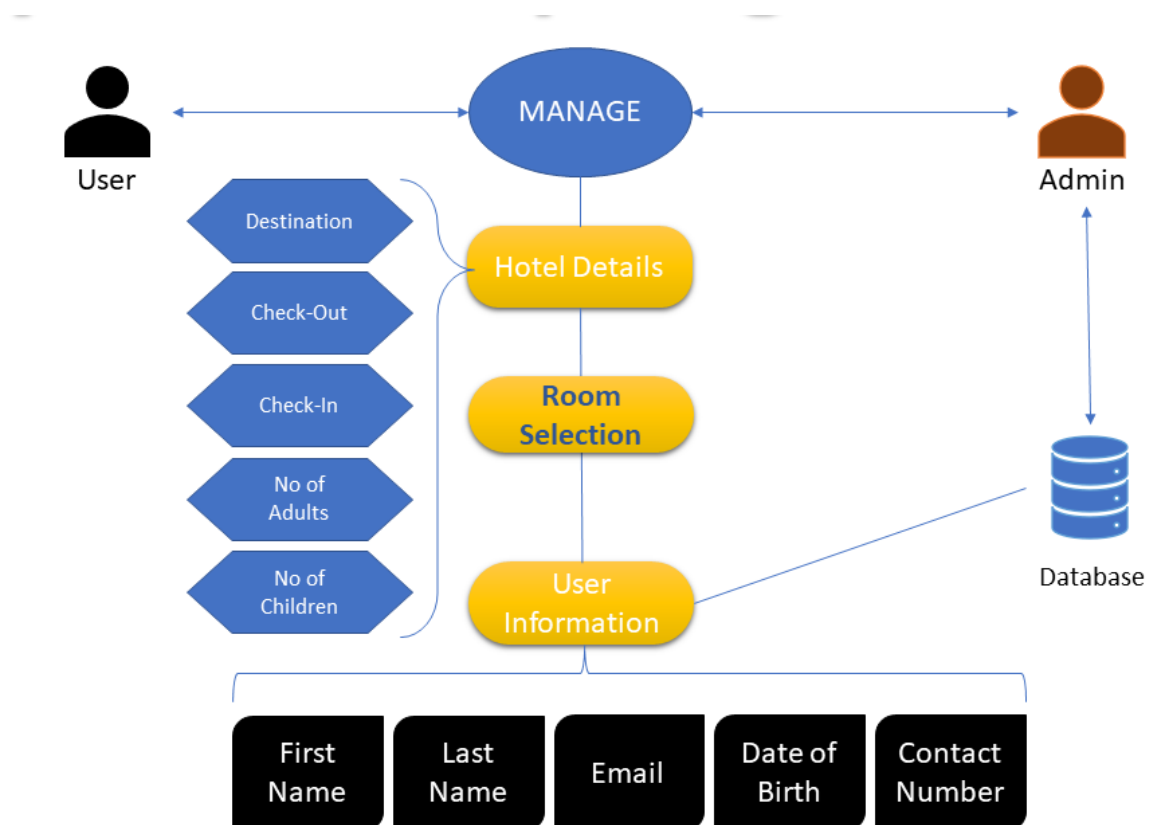

Represent the process

Or

Relation between two entities

Line:

Connects two entities. Also helps in showing relationships.

Event Table

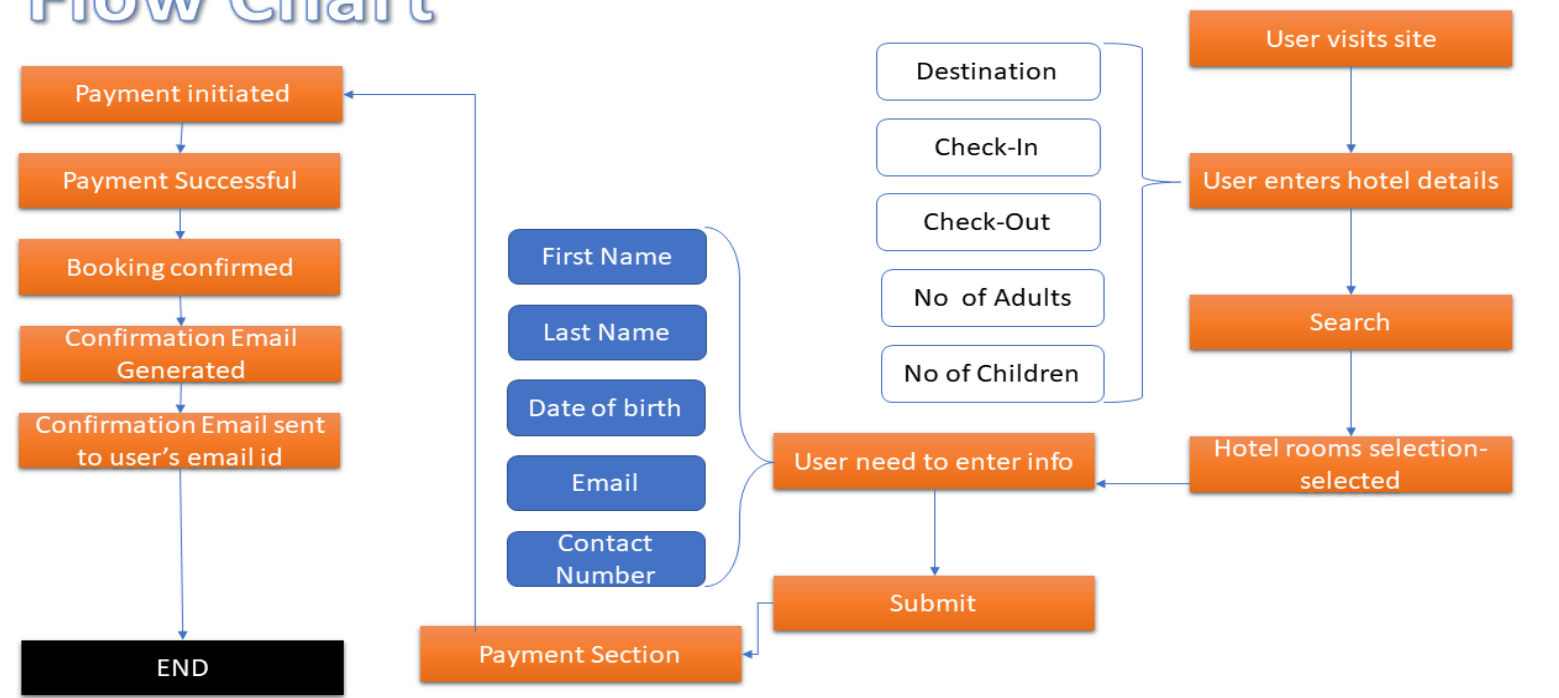

The event table is a table of data that is typically written to the logfile for each scenario and also appears in the Analysis window. The event table contains timing information about specific events that occur during the scenario.

Event	Trigger	Source	Activity	Response	Destination
User enters hotel details.	Processing hotel details.	User.	Saving hotel details.	Details Saved.	Database.
User chooses listed hotels.	User selects the listed hotel.	User.	Hotel Selection.	Hotel Selected.	Database.
User inputs His/her details.	Adding details. Event Table	User.	Saving user's Data.	Details saved.	Database.
User enters payment information.	Processing payment Information.	User.	Initiating payment.	Payment Processed.	Payment Account.
Generating confirmation of user's booking. (ticket)	User confirms booking.	Automated Email System..	Generating Confirmation ticket.	Confirmation sent though email.	Email id given by the user.

Flow Chart

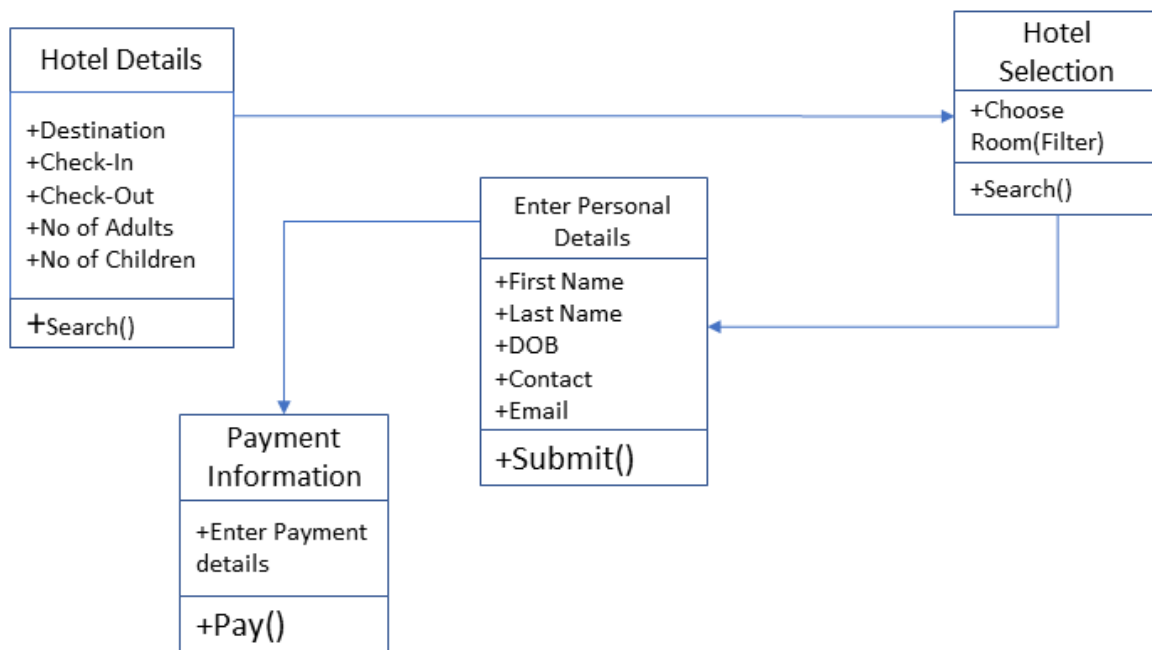

A flowchart is a type of diagram that represents a workflow or process.

Flow Chart

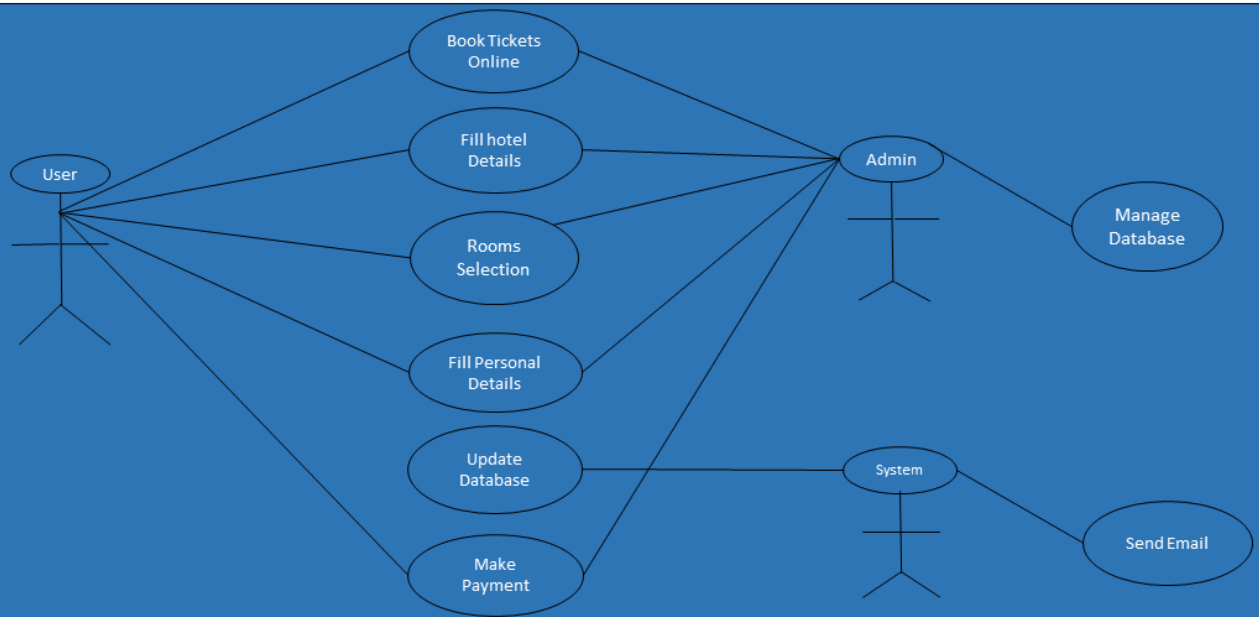

Class Diagram

a class diagram in the Unified Modelling Language is a type of static structure diagram that describes the structure of a system by showing the system's classes.

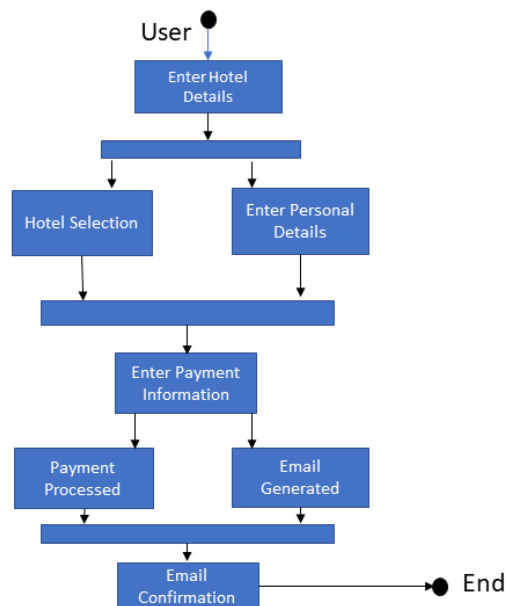

Use Case Diagram

A use case diagram is a graphical depiction of a user's possible interactions with a system.

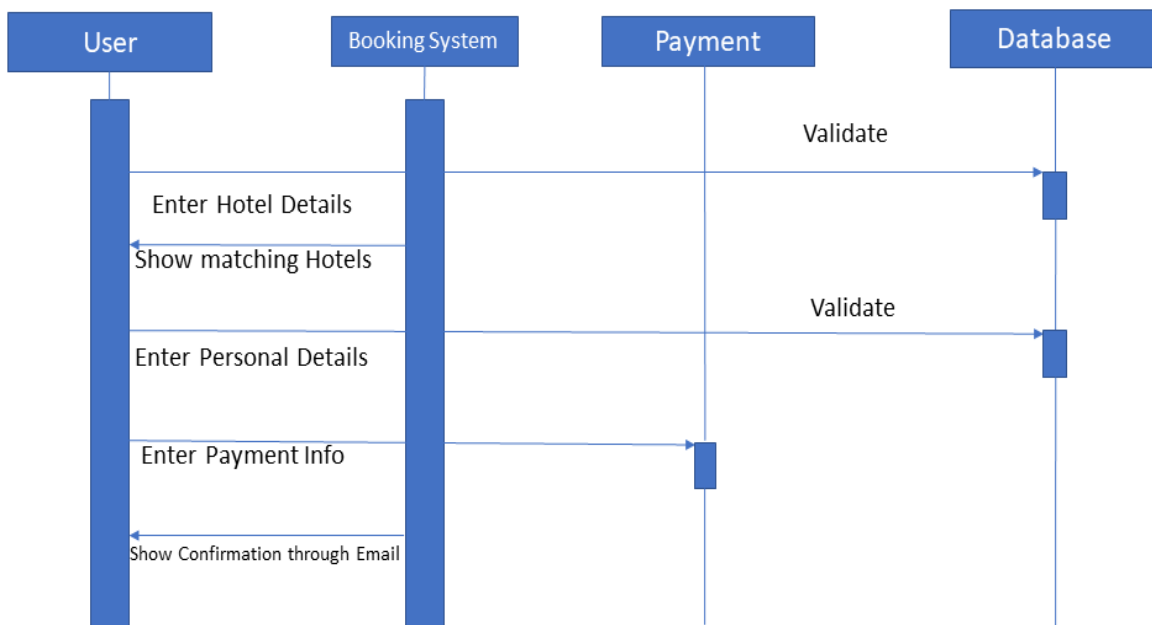

Activity Diagram

Activity diagrams are graphical representations of workflows of stepwise activities and actions with support for choice, iteration and concurrency.

Sequence Diagram

Sequence Diagrams are interaction diagrams that detail how operations are carried out. They capture the interaction between objects.
